The varieties we are listing are available for bedding plant production only, not for commercial production purposes.

**Heirlooms . . .** They are the antiques of the seed world. These treasures are always non-hybrids and are open pollinated with a long history of selection. Many are the base in which the F-1 Hybrid of today were established. They are prized for their flavor, hardiness, color, yield, and disease resistance. "Old Fashioned" varieties are very popular today after being passed from generation to generation and reflect back to an individual's heritage. They are what our relatives grew a hundred or more years ago.

## CARROT

18,000 sds/oz

1 oz. will plant 100 ft. row. 3-1/2 to 4 lbs. per acre. Sow as early as the ground can be worked, sow direct in rows 12-18 in. apart. Make successive plantings until August 1st. About 2-3 lbs. per acre when direct seeding. Carrot fly can be a nuisance insect. If a problem every year; grow Herb, Sage nearby to repel the insects. The brighter the orange color, the higher the level of Beta Carotene and vitamins. Breeders began developing orange carrots about 400 years ago - before that time, they were purple and considered undesirable! A study at Harvard Medical School found that Beta Carotene found in carrots, pumpkin, squash and red peppers can reduce the risk of stroke by 68%. Also known to reduce the risk of smoking related cancers, lowering the blood pressure and preventing constipation.

The more color the higher the content of beta-carotene and vitamins.

## GOJI BERRIES

33,000 sds/oz

No work has been conducted on fertility requirements in the region; however a good starting point would be to amend the field as for tomatoes. Adaptable and grow in a range of soil types, with preferred pH of 6.5 to 7.0. They will not tolerate salinity well and prefers high fertility soils. The best growth is made in relatively light soils that are well - drained such as sandy loams or loams and in areas with plenty of sunshine. Plants will begin fruiting two years after seeding, or the year after planting if one-year old transplants are used. Full yields will be reached four to five years from seeding. Nitrogen at 75 to 90 pounds per acre per year is recommended for a mature planting, split into three applications applied at budbreak, at flowering and then as fruit begin to ripen. Plants are sensitive to high salt levels; compost can be used to provide nutrients as long as salt levels are not excessive.

### LYCIUM BARBARUM - 8100

96-120 in. - 33,000 S. Amazingly nutritious and so easy to grow, this vining shrub is finally making it to American gardens. A staple of Far Eastern diets for many years, but the antioxidant-rich, protein intensive berry is now coming to our plates via an easy, fast-growing vining shrub in the sunny to partly shaded garden. Called a superfruit because its so rich in health benefits. Nearly 13% protein, it is also very high in vitamin C and is powerful antioxidant. Eaten fresh from the vine or dried and then cooked, it has a pleasant, tomato-influenced tart flavor and herbal scent. The berries themselves are oblong (rather like olives) and orange-red, beginning green and then ripening and remaining on the plant from midsummer all the way to frost. May take a season to establish in the garden, but once it makes itself at home, expect it to put on 4-5 feet of growth a year.

The narrow strappy leaves are deeply puckered for a gorgeous appearance. The upright plants are easy to harvest and offer improved bolt tolerance over traditional strains. The dark color is striking when displayed in mature bunches and it also adds an unexpected element to baby mesclun blends.

### DWARF GREEN CURLED - 7722

Ornamental as well as edible with lots of earthy, nutty flavor. The leaves are so hearty that even when well cooked they retain a wonderful firm texture. Well suited to braising in a bit of broth, or simply blanch in boiling water, then saute in olive oil with garlic and a chile or two. A sprinkle of salt and a squirt of lemon are nice too. Flavor is enhanced by frost. Extremely winter hardy.

### PORTUGUESE - 8205

7,500 S. 85 days. (Couve Tonchuda). A bit more heat tolerant than other kales, for a longer harvest period on either end of winter season. Leaves are large flat, rounded, similar to collard, but very large and with very prominent white veins, earning some strains a variety name of costata, meaning ribbed. The leaves are more succulent and the flavor is more cabbage-like than other varieties. The fleshy stems are enjoyed as well. Definitely an exciting addition to an already illustrious group.

 For selling onion plants in flats, seed 7-10 seeds per in. of row and 1 1/2 to 2 in. apart in row about 6 weeks before offering the plants for sale. Short day length varieties like Bermuda and Sweet Spanish have been particularly good sellers. An oz. will plant a 100 ft. row; 3-4 lbs. an acre in rows 18 in. apart. Quercetin is the onion chemical that fights the formation of blood clots and may protect you from elevated levels of cholesterol. It is found in the yellow and red onions, but almost none in white onions and only in some forms of garlic. To stop the itching and stinging of a bee or mosquito bite, rub the area with an onion. Eating raw onions will help flush fat from the body and lower cholesterol. Herbalists used raw onions to treat dysentery and other hot climate diseases. Be kind to your eyes - place raw onions in the freezer for 30 minutes before cutting and this will eliminate tearing.

**PEPPER, HOT**

4,000 sds/oz 75° 10-15 days

For quick germination, soak 3-4 days in water before sowing. Sow 6-7 weeks before outdoor planting. Transplant 10-15 days after seeding; germinate seed warm. Hot peppers and the capsicum oil in hot peppers can not be neutralized by water. Wash hands or rinse mouth in vinegar to alleviate discomfort in an emergency. Bread, bananas, pasta, or potatoes will alleviate any burning sensation. Never touch your face or eyes after handling hot peppers. (Warm growing temperatures develop the hottest peppers). Hot peppers are rated by their Scoville level. (The higher the number, the hotter the Pepper). The rating we list is for normal, moderate conditions. Peppers grown under stress, high temperatures and high humidity will be 10-15 times hotter after drying. Hot or Chili Peppers will help relieve respiratory problems, prevent blood clots, help lower cholesterol, will speed up metabolism and lower the risk of heart related problems.

**7,000-9,000 sds/oz 75°-80° 7-14 days**  
Sow seed 6-8 weeks before time to plant out. Transplant 14-21 days after seeding. For best germination, cover seeds lightly after sowing. About 1/4 oz for a 100 ft row or 2 lbs per acre if direct seeded. If White Fly is a problem, plant Marigolds and Herb, Basil nearby to help repel the insects. Tobacco users should not come in contact with seedlings to prevent tobacco virus. Planting Radishes, Rue, and Pennyroyal will repel many insects.

Days indicated after each variety are from when plants are set out in the garden to ripe fruit. Indeterminate habit will require staking. Determinate habit may sometimes require caging.

Lycopene is a carotenoid that is abundant in Tomatoes and makes them red. It is a strong antioxidant and is helpful in preventing cancer. Processed and cooked tomatoes in sauces are more easily absorbed than raw tomatoes.

Increase your yields and fruit size by 2-4 oz. by growing on stakes or cages.

For your selection of disease resistant varieties, we have indicated after the variety the strength of the disease resistance: V = Verticillium resistant; F = Fusarium resistant; N = Nematode resistant; T = Tobacco Mosaic resistant, A= Alternaria Resistant.
